

## Contents of the course Boundary Element Methods in Statics and Dynamics (3V+1Ü)

### Lecture

- 1. Introduction and Basics**
  - 1.1 Numerical modelling and comparison with FEM
  - 1.2 Method of weighted residuals
  - 1.3 General approach (direct method)
- 2. BEM for 2D Potential Problems**
  - 2.1 Heat conduction: Laplace and Poisson equation
  - 2.2 Fundamental solutions in 2D
  - 2.3 Boundary integral equation
  - 2.4 Discretisation of the boundary
  - 2.5 Collocation method
  - 2.6 Substructure techniques
- 3. BEM for 3D Problems of Elastomechanics**
  - 3.1 Equations of linear elastomechanics
  - 3.2 Elastostatic fundamental solutions
  - 3.3 Boundary integral equations
  - 3.4 Discretisation in 3D
  - 3.5 Collocation method
- 4. BEM for Linear Acoustics**
  - 4.1 Acoustic wave equation
  - 4.2 Harmonic waves and Helmholtz equation
  - 4.3 Collocation BEM for Helmholtz equation
  - 4.4 Examples of acoustic problems
- 5. Dual Reciprocity Method (DRM)**
  - 5.1 Treatment of domain terms
  - 5.2 Dual reciprocity formulation (Helmholtz, diffusion, wave equation)
  - 5.3 Radial basis functions
  - 5.4 Time integration

### Exercises, Homework Sheets and Homework Project

- 1. Numerical Integration**
  - 1.1 Regular numerical integration for 1D and 2D
  - 1.2 Weakly singular integration for 1D and 2D
  - 1.3 Definition of strongly singular integrals and Cauchy principal value
- 2. Implementation of 2D-Laplace equation**
  - 2.1 Preprocessing: Geometry and boundary conditions
  - 2.2 Programming the boundary integral equations in MATLAB
  - 2.3 Solving the unknown boundary values
  - 2.4 Calculating interior field point values
- 3. Acoustics**
  - 3.1 Examples from Acoustics (1D, 2D, 3D)
  - 3.2 Boundary Integral equation and Fundamental solution
